

Container Care Instructions... Gardens Oy Vey Outdoor Sun to Part Sun Summer and Winter Frost Hardy

Wolfgang and I have created many wonderful and long lasting containers for Ourselves and Others, over 25 years, for a wide variety of indoor and outdoor situations.

We would like to let you know how to take care of your container and maintain it healthy and happy for a long time to come.

The container you will take home is basically an outdoor sun container year around.

We do not recommend bringing it indoors, However we are aware that it does happen over and over again.

So it needs to stay outdoors in full sun to part sun for the summer and in winter It will survive the worst winter..

If you do bring it inside, give it the most sun you can find. Than in spring expose it do sun very gradually, as plants coming out of the house do get sun burned.

Pretty much ignore your container in the cool and winter season, let the rains take care of it.

Water your container once a week (drench) once temperatures goes above 80°.

If you have a tub you can submerge the container all the way, than let it drain.

That is a great way to water, but a hose with a soft nozzle will do fine.

Fertilize with seaweed once to three times a year, that is all your container needs.

Some of the plants will undergo winter and spring changes, conifers will shed some of their lower branches and some of the plants will undergo color changes.

If any of the plants will for some reason die on you from a mistake or old age of the plant, it may be time to visit us for some free advice on how to replace it.

We are very good at this and love to have you here at our nursery.

Many Thanks for your Business and Best Wishes. Diane and Wolfgang. Gardensoyvey.com
