

## Planting Instructions

Unless you are planting on top of rocks...you probably have poorly draining soil. Many of the plants we sell are Tennessee Natives used to living on well drained slopes that get winter rain and summer drought. Most plants from most places around the world are site specific and unless you mimic the site or are planting a bog...your best bet is to raise the planting hole rather than dig a deep moist hole. If you dig a deep hole and add lots of nice wet soil amendments you will **DROWN YOUR PLANTS.**

We recommend that you add **ON TOP OF YOUR CLAY... 4" of pine bark.** (And, if budget permits, 1" of **REAL MANURE.** (The 4.00\$-6.00\$ bag.)) Mix this into the top 3-4" of your soil to create a **WELL DRAINED PLANTING HOLE.** Plant into this **Light, Loose, Fertile, Magic Mix.** The top of your root ball should be in the top part of this mix. To finish add 1" of **Hardwood, Cypress, or Pine Needle Mulch** on top of the soil. **Fertilize and Water.**

This will change your success rate to 99.9%.

Best Wishes. Diane and Wolfgang.

### A FEW PLANTS THAT HATE WET FEET :

Annabelle Hydrangea, Hayes Starburst Hydrangea, Any Oakleaf Hydrangea, Native Azaleas, Most Trees and Shrubs.

Many Perennials. Salvias. Tiarellas. Ferns. Probably 80% of plants or more.

If you are in the desert or on top of rocks. Just add Manure.
